

The first step is to identify the variables that are likely to influence the dependent variable. In this case, the dependent variable is the number of sales, and the independent variables are the advertising budget, the number of sales representatives, and the number of sales calls. The next step is to collect data on these variables. This can be done by tracking the advertising budget, the number of sales representatives, and the number of sales calls over a period of time. Once the data is collected, the next step is to analyze it. This can be done using statistical methods such as regression analysis. The final step is to use the results of the analysis to make decisions about the advertising budget, the number of sales representatives, and the number of sales calls.
